Palustrine - PFO Forested Broad-Leaved Deciduous

Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.

Forested Broad-leaved Deciduous wetlands are dominated by broad-leaved deciduous trees > 20 ft (6 m) tall which cover > 30% of the area. Broad-leaved Deciduous Forested Wetlands are found throughout the U.S., but are most common in the South and East. These wetlands generally occur on mineral soils or highly decomposed organic soils.

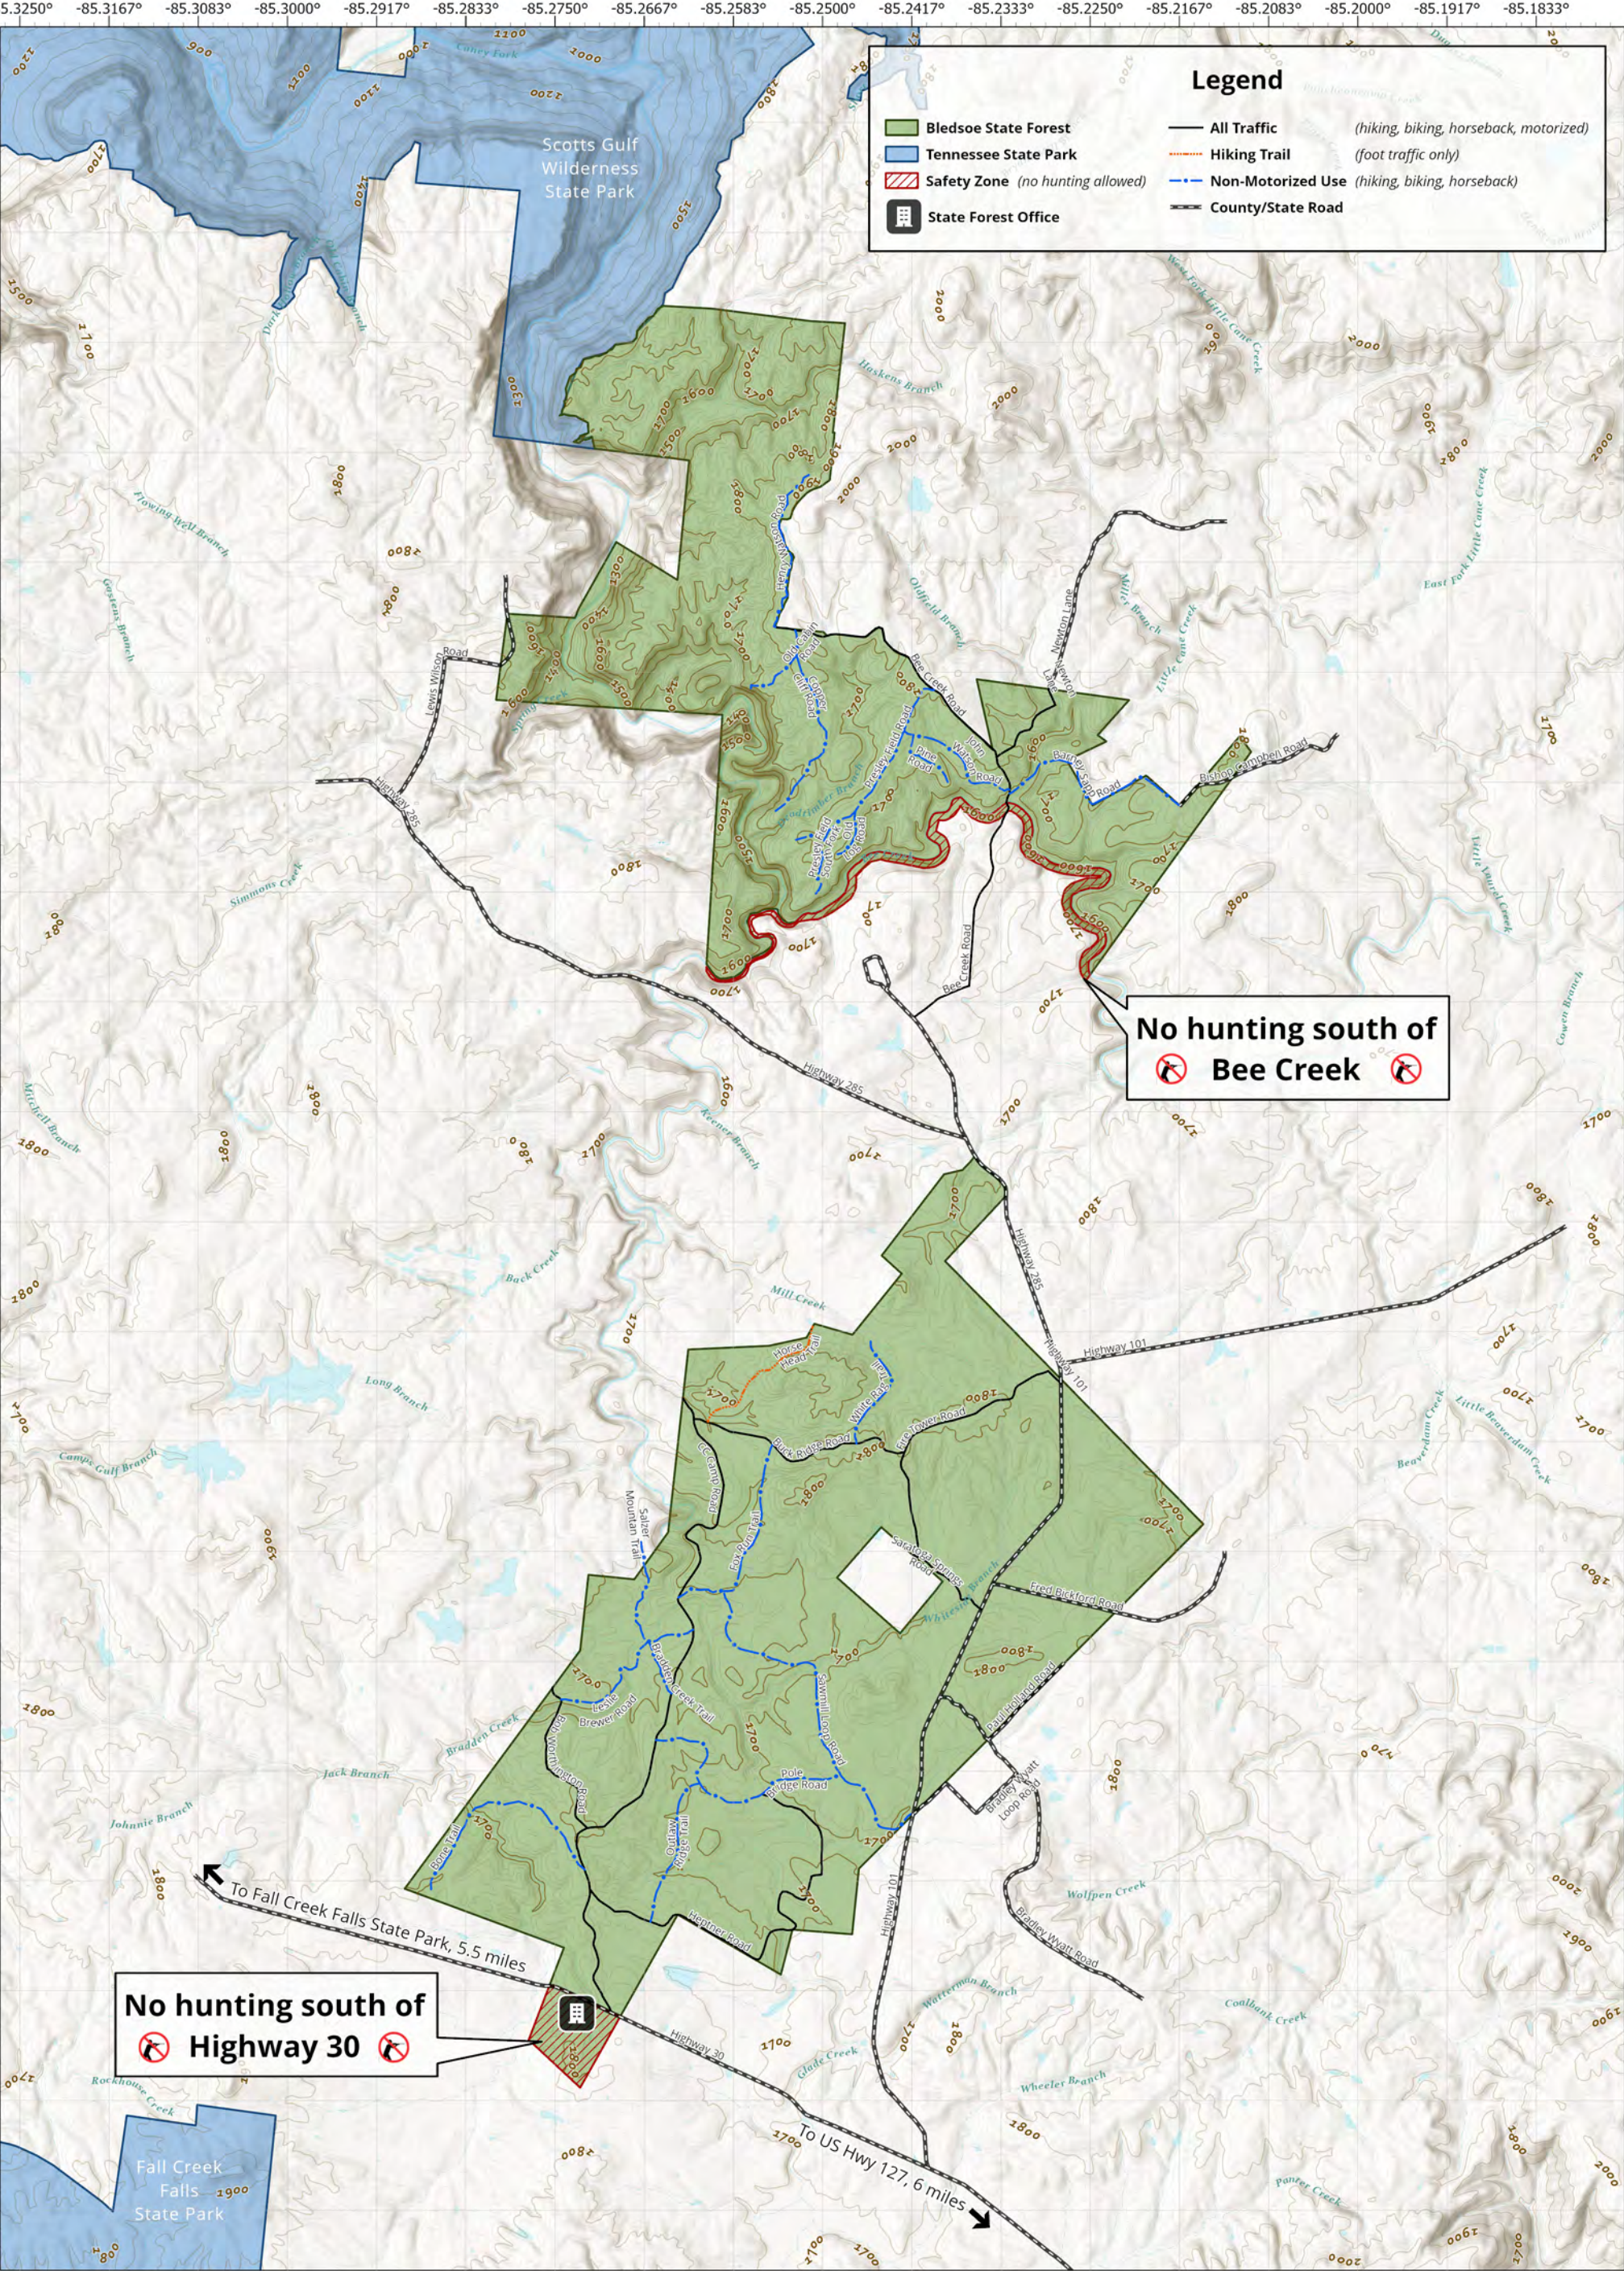

- Typical tree species include:
- Red maple (*Acer rubrum*)
 - American elm (*Ulmus americana*)
 - Ashes (*Fraxinus pennsylvanica*, *F. nigra*)
 - Black gum (*Nyssa sylvatica*)
 - Tupelo gum (*Nyssa aquatica*)
 - Swamp white oak (*Quercus bicolor*)
 - Overcup oak (*Quercus lyrata*)
 - Swamp chestnut oak (*Quercus michaux*)
